DEDICATION

To my children, who are the gravity of my vertical line.

To my bloodline, who paid the cost of my survival when the machine was broken.

And to every autonomous mind refusing to grab the handles of a complacent world. This architecture belongs to you.

EPIGRAPH

"The primitive mind mistakes the absence of a safety net for exposure. The sovereign mind understands that stripping away the handles is the only way to force the vision to become total. Safety is not a physical tool you hold; it is the absolute precision of your own alignment."

— THE LOUIEWOOD PARADOX

AUTHOR'S NOTE

This book is not an academic lecture, nor is it a performance designed to solicit the cheap consensus of the crowd.

The pages that follow contain the raw, unvarnished blueprint of my own timeline—from the chaotic theater of grassroots politics and the deep, light-devouring vacuum of a near-fatal biological collapse, to the high-velocity execution of the **FRANCISGLIDE** movement on the mountain roads of the Philippines.

You are about to read a narrative engineered through real-world friction. When I talk about letting go, I am not speaking metaphorically. I am talking about the terrifying millisecond where your hands leave the rubber grips at high speed, the wind slams into your chest, and your nervous system is forced to choose between primal panic or absolute core sovereignty.

I wrote this manuscript with the exact same intention I bring to the asphalt: without defense, without compromises, and at ultimate velocity. Read it with your eyes scanning the horizon, or don't read it at all.

A NOTE ON RISK AND EXECUTION

The mechanical designs, custom throttle modifications, and high-speed hands-free maneuvers detailed within this text—known collectively as the **FRANCISGLIDE**—represent the outer limits of extreme precision riding and physics-based vehicle dynamics.

This literature documents a sovereign spiritual and mechanical evolution; it is not a manual for the uncalibrated. Do not attempt to replicate the physical feats recorded herein without the requisite mastery of mass alignment, predictive vision, and specialized engineering infrastructure. The road tolerates zero illusions of control.

PROLOGUE: THE SOVEREIGN PARADOX

Human beings are terrified of empty hands.

From the moment you are born, your first primal instinct is to find something to grasp—a mother's finger, a blanket, a lifeline. As you grow, the objects change but the desperation remains identical. You hold onto titles, onto political machinery, onto validation, onto toxic dependencies, and onto the handlebars of whatever vehicle you think is keeping you from colliding with the earth. You grip them until your knuckles turn white, convinced that the tighter you squeeze, the more control you have.

It is a beautiful, universal lie.

True control does not exist in the frantic energy of your grip. It lives in the structural integrity of your center before you ever reach for a safety net.

This book is a chronicle of an execution. It alternates between a cold blueprint of human alignment and a messy, high-velocity autopsy of a life that tried to break itself against the concrete of reality. You are about to step onto the unyielding roads of Gingoog City. You will ride pillion through a chaotic landscape of teenage discovery, the hyper-reactive theater of local politics, the white noise of hedonistic vice, a biological collapse that turned my own mind into a war zone, and a literal, three-night standoff with the Grim Reaper where the only weapon left in my inventory was a smirk.

I know we say we see the Reaper in the movies—with the sharp blade and the long black hood—but when you face him outside your front door while your family is casually eating snacks in the kitchen, you realize mortality has a very strange sense of timing. You either freeze under the pressure, or you realize that the shadow only has power as long as you stay barricaded behind the glass.

Every milestone in my life was bought with a piece of skin, a dropped transmission, or a moment of total psychological isolation. But the law that held the system together at 60 km/h on a

mountain descent in 2017 is the exact same law that keeps me balanced today as a father, a writer, a coder, and a pioneer hunting down a literal world velocity record.

I am not writing this to entertain you, to fill space, or to demand your applause. I am writing this to show you what remains when you strip away every single buffer between yourself and the consequence of motion.

The safety layers are gone. The engine is running.

Let go of the bars.

CHAPTER 1: THE GRIP

The first directive delivered to any human being who mounts a mechanical apparatus is simple, intuitive, and fundamentally flawed: hold on.

This instructional mandate is passed down through generations of riders, drivers, and individuals navigating the friction of everyday life. Locate the controls, wrap your fingers around the rubber grips, and clamp down with a white-knuckled intensity. To the primitive brain, the geometry of this survival mechanism is absolute. If the terrain shifts violently beneath your feet, your hands are assumed to be the primary interface of salvation. If an unpredictable environmental variable forces the front wheel of your machine to twitch, your musculoskeletal system reacts instantly to overpower the deviation. You grip because you have been conditioned to believe that the handlebar is the ultimate extension of your intent. You grip because you think that your frantic, muscular intervention is the only thing standing between your body and a catastrophic collision with the concrete.

But if you strip away the fear and analyze the physics of a moving motorcycle under clinical scrutiny, you discover a truth that borders on the terrifying: the machine doesn't actually need your panic to stay upright.

A two-wheeled vehicle in motion is an engineering marvel designed to achieve its own sovereign equilibrium. Through the convergence of gyroscopic stability, rake geometry, and trail mechanics, a motorcycle at velocity possesses an inherent, unyielding desire to flow forward in a straight line. It wants to balance. The physics of the machine are already optimized to cut through chaos and find the center. When you analyze it deeply, the act of gripping the bars is rarely about stabilizing the vehicle beneath you. The grip is an emotional transaction. It is an unconscious mechanism designed to stabilize the chaotic insecurity raging inside your own nervous system.

Consider the reality of how systemic friction operates when your hands are locked onto the controls out of pure anxiety. The loop begins the moment an external variable—a pothole, a patch of loose gravel, or a sudden gust of wind—causes the front wheel to make a microscopic twitch. In its natural state, the machine's geometry would instantly self-correct within a millisecond, settling back into its path of least resistance.

However, when your hands are frozen in a state of high-tension panic, that natural self-correction is completely blocked. Your anxiety turns your body into an aggressive conductor for noise. Every micro-tremor of your stress, every sudden spike of adrenaline in your blood, and every nervous contraction in your shoulders travels down your arms like an electrical charge, forcing itself directly into the steering head.

Instead of letting the machine balance itself, you execute a frantic over-correction. This muscular intervention causes a violent distortion across the entire chassis. The front wheel twitches harder, the rear tire breaks traction, and the system falls into a severe wobble. You are the one who initiated the instability through your desperate need to control it, yet when you finally wrestle the machine back into compliance through sheer brute force, you praise your hands for saving you from a disaster that you created.

This loop is not exclusive to the asphalt of Gingoog City. It is the exact psychological baseline of the average human being navigating the modern world. Most people operate on a permanent setting of constant, white-knuckled over-correction across the entire infrastructure of their personal, professional, and spiritual existence. They live in a state of hyper-reactive steering, gripped by the illusion that if they are not actively manipulating every single variable around them, their world will fall apart.

They cling tightly to toxic political dynamics because the familiarity of the conflict feels safer than the vast emptiness of real autonomy. They anchor themselves to rigid institutional routines and industrial metrics of validation because they need a scorecard to tell them who they are. They stay locked into safe, predictable dependencies

because the alternative requires stepping into an open space where no mechanical buffers exist to protect them from their own thoughts.

These individuals mistake the frantic busywork of constant crisis-management for genuine direction. If their hands are not actively fighting an engineered emergency, they feel a profound sense of existential dread. They have become so addicted to the weight of the handlebars that they can no longer conceptualize what it means to fly.

To break clean from this collective noise and enter the domain of elite execution, you must first commit your mind to an uncompromising study of the release. You have to look at the rubber grips of your current reality not as a permanent lifeline, but as a temporary, fragile safety layer designed to conceal the deep structural vulnerabilities of your internal alignment.

When you decide to let go, you are not merely performing a physical stunt; you are executing a psychological revolution. You are deliberately removing the quick-saves, the last-second inputs, and the defensive crutches you have relied on since childhood. You are stripping away the filters that mask your imbalances and forcing your soul to answer a singular, heavy question: when you take away the handles you have used to steer your life, what is actually left carrying the system?

The answer to that question cannot be found through casual contemplation. It cannot be studied in the safe, structured confines of a classroom, nor can it be uncovered while hiding behind the protective metrics of an institution. It requires an absolute, uncompromised confrontation with the vacuum. It demands that you take your hands completely off the grips, allow the velocity of your life to hit maximum pressure, and watch with open eyes as the illusions of control burn away to reveal the raw, unshakeable bedrock of your true foundation.

CHAPTER 2: THE VACUUM

The exact millisecond your fingers open, clear the grips, and rise into the open air, you cross an invisible threshold and step directly into the vacuum.

It is a transition marked by a sudden, violent deceleration of environmental noise. For the entirety of your conscious existence, the direct friction between your palms and the external steering mechanisms of your world has provided a steady, comforting stream of sensory feedback. That physical contact point serves as a psychological reassurance—a mechanical proof that you are securely plugged into the machinery of reality, that you possess a direct hand in dictating the terms of your trajectory.

When that contact point is abruptly severed, the feedback loop goes completely dead. The comforting hum of secondary control drops into absolute silence. You are left floating entirely above the physics of a moving platform, suspended in a pocket of pure, unadulterated reality where the standard rules of navigation no longer apply.

In the vacuum, the universe refuses to tolerate a lie. There is absolutely nothing left to absorb your mistakes.

When your hands are firmly planted on the bars, it is incredibly easy to hide a crooked spine, an off-center hip, a fractured focus, or a spirit divided by doubt. If your internal alignment is compromised, you can simply apply a fraction of a millimeter of opposite muscular pressure to the left or right grip. The hands act as a permanent, systemic filter for your personal imbalances, masking your deep structural flaws before they have the opportunity to manifest as catastrophic, public failures. You can live a chaotic, uncalibrated life internally, as long as your hands are strong enough to force the external world to look straight.

But the moment the safety layer is deleted, the filter vanishes completely. The vacuum strips you naked. Every hidden tension locked within your core, every uncalibrated lean of your torso, and every shadow of hesitation in your mind is translated instantly and

without modification into the chassis of your machine. If you are leaning left internally because you are carrying unresolved baggage from your past, the bike veers left. If your focus wavers for a fraction of a second because you are looking for validation from the crowd, the front wheel begins to hunt.

The vacuum does not create your instability; it simply refuses to lie to you about the instability that was already living inside your skin.

This is the exact reason why the vast majority of men spend their entire lives actively running from the vacuum. They keep their schedules intensely crowded, their social circles superficial, their vices hyper-active, and their hands deeply buried in the steering mechanisms of temporary empires because the silence of a detached moment is too heavy for their bones to carry. They dread the quiet because the quiet is an unyielding mirror that forces an immediate, brutal inventory of what is actually holding them upright when the world stops tracking their performance. They are terrified to let go of the bars because they suspect that if they ever stop steering, they will discover that there is absolutely nothing of substance living inside their core.

To master the art of no-hands execution, you cannot approach the vacuum as an enemy to be conquered, nor can you treat it as a temporary hazard to be rushed through. You must learn to inhabit it. You must systematically train your nervous system to look directly into the sudden silence of a detached life, acknowledge the immediate, amplified manifestation of your deepest flaws, and remain completely unmoved as the system recalibrates beneath you.

When you drop the bars, your primary objective is not to steer the machine through physical force, but to become completely still within your own skin. You must allow the velocity of your movement to act as the primary stabilizer while you focus entirely on your internal architecture. You must align your spine, stabilize your breathing, and lock your mind into a state of absolute, unshakeable presence.

When the external buffers disappear, absolute internal honesty is the only currency that prevents a fatal crash. You must learn to trust that the machine wants to balance, and more importantly, you must learn to trust that your own design is fully capable of navigating the void without a safety rail to hold onto.

CHAPTER 3: THE PHYSICS OF ISOLATION

To execute a vision that commands global authority, you must first master the physics of isolation.

True sovereignty cannot be engineered while you are constantly tuned into the frequency of the crowd. The collective consciousness of the average population is powered entirely by a desperate need for consensus, a baseline craving for collective validation, and an inherent terror of any trajectory that cannot be measured by standard institutional metrics. The moment you step away from the established paths and begin designing an uncompromised legacy, the crowd will instinctively attempt to pull you back down into the safety of their shared limitations. They will offer you their advice, project their own deep-seated fears onto your strategy, and present their superficial structures as your only path to security.

If you allow their opinions to penetrate your perimeter, you introduce a fatal impurity into your internal system. You create a divided mind, and a divided mind cannot maintain balance at velocity.

Building a vision in complete isolation means establishing a clean, impenetrable boundary between your strategic execution and the validation of the world. It requires you to operate in a psychological space where the applause of the audience means absolutely nothing, and the criticism of the uninitiated means even less. You must become completely self-contained—a sovereign entity that derives its validation exclusively from the precision of its own metrics, the accuracy of its own testing, and the unyielding truth of its own results.

This level of isolation is not a passive state of loneliness; it is an active discipline of strategic insulation. It is the understanding that the highest forms of alignment are always discovered when you are completely alone on the road, far away from the safety nets and soft cushions of the crowd.

When you isolate your mind from external noise, your perception undergoes a profound evolutionary shift. Your awareness becomes total. You stop looking at the superficial movements on the surface of the asphalt and begin reading the deeper, underlying currents of momentum. You develop the rare capacity to see a variable coming miles before it ever crosses your path, giving you the clarity needed to adjust your internal alignment with absolute calm, rather than reacting with a frantic, white-knuckled correction at the last possible second.

Isolation strips away the cheap illusions of support and forces you to realize that you are the sole engineer of your trajectory. If the build succeeds, it is because your internal architecture was flawless; if the system collapses, it is because you allowed a fracture to exist within your own design.

This discipline requires a savage level of emotional intelligence and a total elimination of the ego. Most people use the noise of their social circles, the titles of their positions, and the constant movement of their busy lives to inflate their sense of importance. They need the crowd to tell them they are moving forward. But when you step into the physics of isolation, your ego is entirely useless. The asphalt doesn't care about your titles, your political connections, or your social status. The road only responds to one thing: the absolute truth of your balance.

If you are off-center, the isolation will expose it immediately, without mercy, and with absolute finality.

To build an autonomous empire, you must learn to love the cold, clean air of the isolated path. You must look at the empty space around you not as a void to be feared, but as a pristine laboratory where you are completely free to engineer the ultimate standard of your life, your brand, and your legacy. You must become so thoroughly anchored within your own core that you can stand completely alone at the starting line, look out at a trajectory that no man has ever successfully navigated before, and feel an unshakeable, smiling confidence because you know that your internal alignment has been proven in the dark, far beyond the reach of any safety net.

CHAPTER 4: THE BANTAAWAN NEUTRAL (2017)

All the high-level philosophy of detachment, the psychological autopsies of the grip, and the clinical mathematics of the vacuum mean absolutely nothing until they are tested against the violent friction of reality. You can theorize about balance inside a clean room for a lifetime, but until your tires hit the hot, unyielding asphalt of a mountain descent, your code is just an unproven hypothesis. My code was born in 2017. It didn't begin in an elite academy or under the supervision of a veteran trainer. It began on the steep, sweeping inclines of the Barangay Bantaawan road in Gingoog City, Misamis Oriental, Philippines.

I was just a kid looking at a machine, driven by a raw, unfiltered curiosity that bordered on reckless execution. The machine in question was my father's Yamaha YBR 125cc—a lightweight, commuter workhorse built for utility, not high-speed performance dynamics. I borrowed the bike, fired up the engine, and headed toward the high-altitude terrain of Bantaawan. When I reached the summit and looked down at the four-to-five-kilometer stretch of continuous, twisting downhill grade that lay ahead, a singular, crazy equation entered my consciousness. I reached down, kicked the transmission into neutral, and let the engine drop into an absolute, dead silence.

There was no mechanical propulsion. There was no exhaust note to mask the environment. It was a pure, freewheeling descent powered exclusively by the gravitational pull of the earth. My only connection to mechanical restraint, my only lifeline to prevent the system from accelerating into terminal chaos, was my right foot resting lightly on the rear brake pedal.

As the velocity began to build and the wind shear started to slap against my chest, the ultimate question materialized in my mind: *What if I let go of the handlebars completely? What if I take my hands off the steering head entirely and see if this machine can find its own center?*

The moment I opened my fingers and surrendered the grips, the illusion of mechanical control was instantly annihilated. Within the

first twenty seconds of that initial release, my nervous system experienced a massive, electric shockwave of pure panic management. Every survival instinct I had ever cultivated since childhood screamed at my arms to reach back out and seize the grips to protect myself from the concrete. But I held my position. I forced my upper body to remain entirely still, and in that sudden vacuum of control, a profound evolutionary breakthrough occurred within my biology.

My body cracked the code of dynamic equilibrium. I discovered, through raw instinctual calibration, that you do not need hands to command the direction of a motorcycle. By shifting my weight, aligning my skeletal structure, and utilizing the core of my torso, I could dictate the precise arc of the machine's trajectory. What began as a terrifying twenty-second experiment instantly expanded into a four-kilometer continuous, hands-free descent. Once my hands left those bars, I made a conscious, unshakeable decision: I would never hold them back again until the road ran out of downhill gravity.

When the road finally flattened out and I brought the Yamaha to a stop, I sat there in the silence, completely blown away. My mind was racing with a manic, triumphant energy, thinking, *"How the fuck did I just pull that shit off?"* I rode home that evening with a smirk locked onto my face, fully aware that my entire understanding of physical and mental balance had been permanently dismantled and rebuilt.

Bantaawan ceased to be just a public road or a geographical location on a map. It became my private laboratory, my sacred training ground, and the foundational bedrock of my legacy. Every single time I visited that mountain road afterward, the routine was unalterable: the moment the descent began, the hands were jettisoned from the controls. I had stepped out of the crowd, isolated my execution, and uncovered a sovereign gift that would eventually demand a confrontation with the global limits of speed.

CHAPTER 5: THE FIRST WOBBLE

Discovering your center on a pristine, predictable run is one thing. Maintaining that center when the entire system begins to oscillate at high velocity is an entirely different caliber of execution. Once you step out of the comfort zone of the grip and allow the vacuum to dictate your movement, you will inevitably encounter the most violent psychological hurdle in the architecture of balance: the first wobble.

The wobble is not a gentle reminder that you are off-center; it is a sudden, aggressive, and highly unstable oscillation of the steering mechanism.

In standard motorcycle mechanics, a tank-slapper or a front-wheel wobble occurs when a disturbance disrupts the alignment of the chassis, causing the handlebars to whip back and forth with terrifying force. To the untrained rider, this is the exact moment where the universe appears to collapse. The physical vibration travels from the metal straight into your bones, and every ancient, hardwired survival instinct buried deep within your DNA screams at you to perform a singular, frantic action: reach out and grab back onto the bars with everything you have.

Your evolutionary design wants you to seize your old dependencies. It wants you to re-engage the grip out of pure panic.

But if you panic and clamp down on the controls while the front wheel is violently oscillating, you commit the ultimate structural error. Your tense arms turn into rigid pillars, transferring the chaotic vibrations of the wheel straight into your upper torso and your core. Instead of dampening the wobble, your frantic over-correction feeds more energy into the disturbance, turning a minor mechanical twitch into a catastrophic, high-speed tank-slapper that will throw you directly onto the concrete.

The wobble demands a response that completely contradicts human nature: you must remain entirely fluid while the world shakes around you.

When the first wobble hit me on my early descents, the mental barrier was immense. You are traveling at velocity, your hands are suspended in the open air, and the machine beneath you suddenly begins to shake its head like an untamed animal. Your brain flashes a warning signal that you are about to crash, about to bleed, about to break. It is a moment of pure panic management.

To survive the wobble without grabbing back onto the grips, you must execute a total cognitive override. You have to consciously suppress the urge to react defensively. Instead of tensing your muscles, you must force your shoulders to drop, relax your arms, and deepen your breathing. You must allow the front wheel to work through its own chaotic cycle without introducing your personal anxiety into the steering head. You must look past the shaking handlebars, lock your eyes onto the distant horizon, and trust that the underlying physics of momentum will self-correct the system if you just have the discipline to stay out of the way.

This physical phenomenon is the exact blueprint for managing the structural crises of a human life.

When you make the decision to live a sovereign, autonomous life, you are deliberately taking your hands off the standard safety nets of society. You are leaving the structured validation of institutions, the comfort of predictable routines, and the protection of crowds. And the moment you step out into that open space, your life will eventually hit its own version of a high-speed wobble. A financial crisis will materialize, a critical relationship will fracture, a professional venture will begin to shake, or an internal wave of self-doubt will hit your nervous system with brutal force.

When the structure of your life begins to oscillate violently, the average man reacts exactly like the panicked rider. He experiences a severe spike of anxiety and immediately grabs back onto his old, toxic dependencies. He runs back to the safe, unfulfilling job that drains his soul; he hooks himself back into the validation metrics of a crowd that doesn't care about his legacy; he compromises his internal boundaries just to stop the shaking. He forces a frantic over-correction because he cannot tolerate the discomfort of

temporary chaos. And through his desperate need to force an immediate solution, he ends up completely destroying his own trajectory.

To build an unshakeable empire, you must learn the art of sitting through the vibration.

When the system shakes, you do not compromise your strategy, nor do you rush to grab onto temporary crutches. You align your core, maintain your long-range focus, and allow the environmental friction to burn itself out against your internal stability. The wobble is not a sign that you have failed; it is a mandatory calibration phase designed to test the structural integrity of your detachment. Once you prove to your own mind that you can look at terminal chaos without reaching for a lifeline, the vibration settles, the steering head locks back into alignment, and you emerge on the other side with a sovereign authority that can never be broken by the wind.

CHAPTER 6: CALIBRATING THE CORE

When you permanently remove your hands from the controls, steering ceases to be an act of manual manipulation and becomes an exercise in pure internal physics.

In a white-knuckled world, steering is entirely superficial. If an average individual desires a change in trajectory, they apply physical leverage to an external tool—they push the left handlebar to lean left, or pull the right to lean right. It is a shallow, mechanical transaction that requires zero self-awareness. You do not need to understand your center of gravity or examine your posture when you have a set of metal bars to pull yourself into compliance. The hands act as a structural bypass, allowing you to force a broken, uncalibrated body to travel in a straight line.

But the moment you enter the vacuum of a hands-free run, that superficial leverage is completely deleted. The machine now reads your body like a piece of high-precision code.

[THE COMMAND CENTER SHIFT]

Superficial Control: External Tool (Handlebars) ——> Manual Force ——> Forced Correction

Sovereign Control: Internal Center (The Core) ——> Mass Alignment ——> Flow Optimization

Without the bars, the front wheel becomes a direct mirror of your central nervous system. If your core is weak, if your hips are misaligned, or if you are carrying an uncalibrated lean in your torso, the vehicle immediately translates that internal flaw into a drift. You cannot fake balance when there is no safety rail to hold you up. To command direction at velocity without hands, you are forced to shift your entire steering mechanism from external tools to internal alignment—you must learn to steer from the core.

Calibrating the core means training the mind to recognize that true stability originates from within, independent of external support structures.

Physically, it requires an absolute stabilization of the spine, a relaxation of the shoulders, and a precise manipulation of your center of mass. You don't fight the wind with your arms; you slice through it by dropping your weight into the frame of the machine and utilizing subtle, microscopic shifts of your torso to dictate the arc of your path. The machine and the body fuse into a single, autonomous ecosystem. You stop reacting to the road and begin flowing with it, commanding the trajectory through an unshakeable presence that emanates directly from your center.

This structural calibration is the exact dividing line between the consumer and the sovereign across every domain of human existence.

Most people spend their entire lives trying to steer their reality through external leverage. When their personal life drifts off-course, when their finances shake, or when their internal world begins to fracture, they immediately look for an external handlebar to grab. They search for a new title, a superficial change of environment, a louder circle of validation, or a temporary vice to pull themselves back into balance. They attempt to manipulate the external variables of their world through brute, manual force, entirely blind to the reality that their trajectory is drifting because their internal core is completely uncalibrated.

They are running a broken system, trying to correct a crooked spine by twisting the handlebars.

An autonomous individual operates from the opposite protocol. When the environment hits them with a sudden variable or a violent crosswind, they do not scramble to manipulate the external world. They do not look for a quick save or an outside dependency to stabilize their position. Instead, they look inward. They audit their own structure, stabilize their mindset, and adjust their internal alignment to match the velocity of the challenge. They understand that if the core is locked, unyielding, and perfectly centered, the external chaos will automatically conform to the trajectory they dictate.

To calibrate your core, you must become entirely comfortable with the absence of external validation. You must be willing to let go of the props that society uses to keep people compliant and upright. It requires you to sit quietly in the vacuum of your own skin, strip away the noisy distractions of superficial control, and rebuild your foundational architecture from the inside out.

Once your core is fully calibrated, you no longer need the world to provide you with a steering rail. You become the steering mechanism. You walk into any environment, mount any machine, and navigate any level of systemic chaos with a calm, smiling certainty—knowing that your balance is not dependent on what your hands can grasp, but on the unshakeable bedrock of who you are at the center of the storm.

CHAPTER 7: THE POLITICAL NARCOTIC (2018)

In 2018, the clean, silent discipline of the Bantaawan road was abruptly cut off by a tidal wave of external noise. The Barangay elections arrived, and through a surge of local momentum, I was thrust into public service as the Sangguniang Kabataan (SK) Chairman of Barangay Bantaawan. I was no longer just a kid freewheeling down a mountain in neutral; I was a public servant running an official youth sector, handed a real budget, a title, and a seat at the political table.

The shift in my personal velocity was instantaneous, violent, and highly intoxicating.

Philippine grassroots politics is an intense, high-stakes theater. It is a world powered entirely by a relentless stream of reactive energy, hyper-localized power struggles, and constant noise. Almost overnight, my primary focus shifted entirely. The deep internal calibration required to ride a motorcycle hands-free down a steep hill was replaced by the chaotic demands of a public position. I completely forgot about the unique talent I had discovered just a year prior. The gift was put to sleep, buried under a mountain of paperwork, community demands, and the seductive illusion of authority.

I went hard into the game. Because I refused to operate halfway, I pulled back the curtain and looked at the political machinery from the inside out, navigating both its pristine execution and its darkest, unvarnished underbelly. I learned exactly how the political game is played on the ground—how alliances are forged over glass rims, how public perception is engineered, and how easily a title can inflate a man's ego until he can no more see his own feet. To survive the manic acceleration of that environment, I adapted to its vices. My reality became an endless cycle of community service mixed with destructive releases: wild parties, intense political maneuvering, heavy alcohol consumption, and substances.

Six months into my term as SK Chairman, I decided to dual-track my existence by enrolling at Gingoog City Colleges. I was

attempting to balance two entirely different worlds: serving my political term by day, attending lectures by night, and drowning the systemic exhaustion in substances and alcohol during the hours in between. I told myself I was simply exploring my youth, maximizing my options, and learning the ways of the world.

In reality, I was committing the ultimate structural error I had warned against in the vacuum of the road: I was letting the external noise of the crowd dictate my center. I was pulling frantically on the handlebars of title, status, and hedonism, completely blind to the fact that my internal core was drifting into a state of severe, uncalibrated decay. When you over-correct a machine with toxic input for too long, the physics of reality will always step in to force a total, violent halt. The crash was coming, and it wouldn't happen on the asphalt—it would happen inside my own blood.

CHAPTER 8: THE BROKEN SYSTEM (THE DESCENT)

When you pump toxic input into a high-performance system for too long, the physics of reality will eventually step in to force a total, violent halt. You cannot run a split existence—dual-tracking public office, college lectures, and a heavy cycle of substance-fueled escapism—without your biology eventually demanding the receipt. In late 2018, my internal architecture completely collapsed.

The descent was swift and absolute. I woke up one morning with a fever so severe it felt like my blood was boiling inside my veins. My strength vanished; the body that had effortlessly balanced a machine down the slopes of Bantaawan could barely support its own weight to cross a room. I was admitted to Lipunan Hospital in Gingoog City, where the initial clinical findings pointed to a severe case of dengue. But as the days bled together, the standard treatments failed to take hold. My blood counts continued to drop, my vitals fluctuated wildly, and the clinical walls began to close in on me.

Recognizing that my system was failing to respond, my family executed an emergency transfer. I was packed into a vehicle and driven down the highway to Cagayan de Oro City, checking into the Capitol University Medical Center (CUMC). For one grueling week, I was confined to a room in absolute isolation.

Medical science offered no relief, and it was during this clinical confinement that the crisis transcended the physical realm. The prolonged high fever broke the perimeter of my consciousness, and my mind descended into a violent, waking psychosis. Severe, terrifying hallucinations began to claw at the edges of my vision. I lost all concept of time, space, and identity. In the rare moments when the mental fog cleared, I was met with a reality that was even more agonizing than the delusions: I had to watch my parents, my siblings, and my entire bloodline exhausting their meager resources, straining their finances, and breaking their own spirits just to sustain my decaying body in a hospital bed.

Seeing the people who carried my blood struggle so intensely for my survival triggered a profound, suicidal despair. I felt like a parasitic weight, a broken mechanism dragging my entire family into financial and emotional ruin. In the dark of that CUMC room, I turned my face to the wall and prayed into the absolute void: *"Hey God, I think I need you to just take me. Put me in peace so that my parents won't have to struggle for me no more. Just cut the cord."*

But death refused to collect on my terms. I didn't die; I just remained suspended in that miserable, clinical limbo.

Finally, a raw, unadulterated fury cut through the suicidal fog. I realized that this white-walled confinement was an insult to my design. I looked at my mother and delivered a flat, unyielding ultimatum: *"Mom, if I can't die yet, then let's just go home. Let's never come back to this hospital again. If I can't recover, then let me be dead in the house, because staying here is just too fucking boring."*

It was a reckless, prideful leap into the dark, but it was the first sign that my sovereign core was attempting to reactivate. I was done hiding behind the clinical safety nets of doctors and machines. If my system was going to crash permanently, I demanded that the impact happen on my own territory, away from the sterile noise of an institution. The paperwork was signed, the extraction was set, and my inner circle mobilized to bring the beast back to the mountain.

CHAPTER 9: THE LANGUAGE OF MOMENTUM

The ride back from the white walls of Capitol University Medical Center was not a gentle transition; it was a high-velocity immersion into a principle most men spend their entire lives trying to evade: the language of momentum.

When you are broken, vulnerable, and completely uncalibrated, the natural human inclination is to slow down, pull over, and seek total immobility. The mind craves a static environment where nothing is moving, falsely believing that absolute stillness equals absolute safety. But immobility is a profound illusion. In the physics of a moving world, decelerating to a complete stop when you are off-center doesn't stabilize you—it causes you to tip over instantly. True stability is not the absence of motion; it is the absolute mastery of speed.

To understand momentum, you must understand the mechanical law of the gyroscopic effect.

[THE MOMENTUM STABILIZATION PRINCIPLE]

LOW VELOCITY ——> High Systemic Vulnerability ——> Micro-Drifts Corrupt Path

HIGH VELOCITY ——> Kinetic Mass Self-Correction ——> Velocity Cuts Through Chaos

When a machine is moving at a crawl—say ten to fifteen kilometers per hour—the kinetic energy generated by the wheels is entirely insufficient to maintain vertical balance. Every minor imperfection in the asphalt, every micro-drift of the wind, and every slight imbalance in your physical posture threatens to destabilize the trajectory. At low speeds, the system is hyper-vulnerable to external friction. You are forced to constantly twitch, steer, and manually adjust the bars just to keep the chassis from succumbing to gravity.

But the moment you open the throttle and push the velocity past forty, sixty, or eighty kilometers per hour, the entire behavioral profile of the machine undergoes an extraordinary evolution. The rotating mass of the wheels generates a massive, unyielding

gyroscopic force. The rake and trail geometry of the front fork locks into its path of least resistance.

At high velocity, the machine develops an aggressive, self-correcting momentum. It begins to cut through environmental chaos like a scalpel. The speed itself becomes an invisible stabilizer, swallowing up the potholes, slicing straight through the violent crosswinds, and overriding the minor imbalances of the rider. The velocity creates a protective kinetic envelope. It forces the system to stay straight because the forward mass is simply too heavy and too focused to be diverted by minor friction.

This is the exact language that my nervous system had to decode to survive the aftermath of the hospital collapse.

I was physically drained, mentally fractured from waking hallucinations, and emotionally empty from the crushing weight of suicidal despair. If I had chosen to live my life at a slow, timid crawl—hiding in a dark room, over-analyzing my trauma, and waiting for a perfect, risk-free environment to begin moving again—the micro-frictions of everyday life would have torn my mind to pieces. The ambient noise of my failures, the financial stress of my family, and the lingering shadows of my vices would have easily overwhelmed my weakened core. I would have tipped over into permanent depression.

I had to learn to trust velocity as my primary medication. I had to realize that the solution to a chaotic life is not to slam on the brakes, but to intentionally accelerate through the turbulence until the forward momentum of your execution stabilizes the system.

When you are moving at maximum velocity toward a clean, uncompromising target, the mind simply doesn't have the luxury of entertaining self-doubt. The speed forces a brutal, instantaneous efficiency. It burns away the secondary thoughts, deletes the anxiety of the past, and focuses your entire consciousness onto a singular point on the horizon. You stop wrestling with the handlebars of your insecurities because the sheer kinetic weight of your forward progress demands total alignment.

Momentum is the ultimate filter for systemic weakness. It doesn't promise a smooth ride, and it certainly doesn't eliminate the risk of a high-speed impact—but it gives you the raw, unadulterated power needed to slice clean through the wind of a broken timeline, converting the very speed that terrified you into the force that anchors your sovereignty.

CHAPTER 10: THE FAST AND FURIOUS EXTRACTION

The discharge from CUMC was not a medical release; it was a tactical breakout. I had signed the papers against medical advice, choosing the dangerous unknown of the mountain over the slow, sterile decay of a hospital bed. My biology was still heavily compromised, my skin was pale, and my clothes hung loosely off a frame that had lost significant weight in less than a week. But the moment my feet hit the concrete of the hospital driveway, the clinical isolation evaporated, and the raw mechanics of the world took over.

My inner circle was waiting. My aunt had arrived with her vehicle, and my family packed inside, treating the extraction with the tense, quiet urgency of a crew carrying contraband across a border. My uncle took the driver's seat. As the engine turned over and we pulled out of the hospital gates onto the busy streets of Cagayan de Oro, an overwhelming wave of claustrophobia hit my chest. The slow, careful pacing of city traffic felt like another cage. The stop-and-go movement, the honking horns, and the cautious steering of the public roads were suffocating a mind that had just spent seven days fighting its own internal demons.

I leaned forward from the backseat, tapped my uncle on the shoulder, and delivered a flat, manic directive: *"Drive it like Fast and Furious, Uncle. Step on the gas. Don't slow down for nothing."*

He didn't hesitate. He dropped the transmission into gear and slammed the throttle down as we hit the open expanse of the coastal highway leading back toward Gingoog City. The vehicle surged forward, the speedometer climbing rapidly past 80, 100, and finally locking in at 120 kilometers per hour.

I rolled the rear window completely down, leaned my head out into the open air, and let the full force of the wind shear slam directly into my face. The sensation was violent, beautiful, and completely therapeutic. At 120 km/h, the ambient air doesn't just pass by you; it compresses against your skin, rushes into your lungs, and creates

an absolute wall of auditory white noise that drowns out every other frequency on earth.

[THE HIGHWAY EXTRACTION MULTIPLIER]

120 km/h Wind Shear ——> Flattens Thought Noise ——> Pure Adrenaline Reset ——> Systemic Extraction

As the trees, the ocean baseline, and the mountain markers blurred into a continuous streak of green and blue outside the glass, I felt a massive, tectonic shift occur within my nervous system. Physically, I was still incredibly weak, running on a near-empty tank of biological reserves. Yet mentally, I was experiencing a wild, manic rush of absolute liberation. The heavy, suffocating layers of suicidal despair, the financial guilt, and the lingering terror of the clinical diagnosis were torn away by the sheer velocity of our progress.

The wind was acting as a physical eraser, scraping the residue of the hospital room off my consciousness. I was empty, I was battered, and I was technically running away from medical safety—but for the first time in months, I felt completely alive.

This extraction was my first practical lesson in using extreme momentum to override a systemic crisis. I realized that you cannot heal a broken mind by moving at a cautious, defensive crawl. If you allow yourself to drift slowly through your recovery, the gravity of your past mistakes will easily pull you back into the ditch. You have to be willing to drop the hammer, open the windows, and let the sheer velocity of your execution flatten the noise of your circumstances. By the time the vehicle finally pulled into the familiar terrain of Gingoog City, the helpless patient was dead. The kid who had mastered the mountain descent was back, and although his body was still fractured, his spirit was locked and loaded for the final, psychological showdown that was waiting for him behind his own front door.

CHAPTER 11: THREE NIGHTS WITH THE REAPER

The fast and furious extraction from the clinical walls of CUMC brought my body back to the mountain, but it did not leave the darkness behind. When you deliberately step out of the protective care of medical institutions while your system is still heavily fractured, you are essentially daring the universe to test the absolute limits of your mental sovereignty. The physical fever of the severe dengue had begun its slow, agonizing retreat, but the cognitive damage remained wide open. My brain was a raw, unshielded circuit board, completely vulnerable to the residual psychosis of my confinement.

The moment the sun dipped below the horizon on my first night back in the house, the true trial initiated.

It began as a sudden, freezing atmospheric drop inside my bedroom. In the deep silence of the Gingoog midnight, the shadows in the corner of the room began to warp, liquefy, and coalesce into a singular, undeniable geometry. Out of the darkness stepped a towering, black-hooded silhouette. It didn't possess a human face; where its features should have been, there was only an absolute, light-devouring vacuum. In its right hand, it held a massive, razor-sharp blade that seemed to draw all the ambient cold of the room directly into its steel.

It was a literal, waking manifestation of the Grim Reaper, standing less than ten feet from my bed, watching my chest rise and fall with an unblinking, predatory patience.

To the average individual, this level of severe psychological hallucination would cause an immediate, catastrophic systemic collapse. Every primal evolutionary circuit would trigger a state of paralyzed terror or a screaming, desperate run for safety. But this is exactly where the resilient, emotionally intelligent irony of the LOUIEWOOD brand kicked into overdrive. My nervous system was so completely burnt out from fighting suicidal despair, political betrayals, and biological failure that my fear response simply broke.

It refused to activate. Instead of freezing in terror, a wild, dark humor flooded my consciousness.

I looked directly into the face of the vacuum, adjusted my pillow, and thought: *"Are you serious right now? This guy is literally standing in my room with a whole scythe while my family is right outside in the kitchen casually eating snacks and laughing."*

The contrast was so completely absurd that it became instantly hilarious. Outside my bedroom door, the everyday rhythm of my household was flowing without interruption. I could hear the crinkle of cellophane wrappers, the sound of spoons hitting bowls, and the muffled background noise of a television show playing in the living room. My family was hanging out, completely oblivious to the metaphysical standoff occurring just inches away behind a thin piece of plywood.

This stark division of realities shattered the entity's leverage over my mind. I realized that the shadow only possessed the power I chose to assign to it. If I allowed myself to buy into the horror of the projection, I would sink right back into the paralyzing helplessness of the hospital bed. But by leaning into the raw, unvarnished comedy of the situation, I stripped the Reaper of its authority. For two more consecutive nights, the routine repeated itself without a single alteration. The sun would set, the room would freeze, and the hooded executioner would take its position at the foot of my bed, brandishing its cold steel. And for two straight nights, I simply stared back at it with a mocking, unyielding grin, entirely refusing to play the victim in my own house.

I had survived the physical descent; I was now systematically exhausting the psychological terrors of the void through sheer, defiant amusement. The shadow wanted a blood sacrifice, but all it was getting from me was an unbothered spectator waiting for the punchline.

CHAPTER 12: OPENING THE DOOR

By the arrival of the third night, the threshold of human endurance had been thoroughly crossed.

When you spend seventy-two continuous hours suspended in a waking psychosis—locked in a silent, nocturnal standoff with a towering, blade-wielding manifestation of your own mortality while your family casually steps past your room—the psychology of fear undergoes a complete structural mutation. Terror is a finite resource. The human nervous system simply cannot sustain a state of high-alert panic indefinitely. Eventually, the adrenaline loops burn themselves down to the absolute bedrock, the survival instincts run entirely out of fuel, and the mind arrives at a cold, unyielding state of pure evolutionary defiance.

I had reached the absolute limit of my patience. The absurd theater of the situation had stopped being a terrifying mystery; it had degenerated into an annoying, uninvited squatter overstaying its welcome in my domain.

I was lying in the dark, my body still weak from the residual fires of the dengue virus, watching the familiar black-hooded silhouette materialize once again near the perimeter of my bed. The ambient temperature dropped, the light-devouring vacuum of its presence expanded, and the razor-sharp blade caught the faint, silver glint of the mountain moon through the windowpane. It stood there with the exact same predatory, unblinking patience it had displayed for forty-eight hours, waiting for me to break, waiting for me to hide under the covers, waiting for me to pray for a rescue that wasn't coming.

Instead of freezing, a deep, silent, and savage fury ignited within my core. It was the exact same uncompromised code that had snapped into place when I first took my hands off the Yamaha YBR 125cc on the steep descents of Bantaawan in 2017. It was the realization that as long as you stay barricaded behind the glass, as long as you allow the illusion of danger to dictate your positioning, the shadow will continue to command your reality.

I pulled the blankets off my legs, swung my feet over the edge of the bed, and stood up.

My knees trembled slightly from biological exhaustion, but my spine was completely locked into alignment. I didn't look for a weapon. I didn't call out for my parents or my siblings who were hanging out in the adjacent room. I locked my eyes directly onto the empty space where the entity's face should have been, took a deep breath, and walked straight toward it.

Every remaining survival circuit in my brain screamed at me to halt. The air grew so intensely cold it felt like glass slicing into my lungs, but I refused to alter the velocity of my steps. I marched right past the silhouette, reached out with a steady hand, grabbed the handle of the heavy front door of the house, and threw it wide open into the midnight air.

"If you're actually here to take me, then let's fucking go right now," I declared into the quiet. *"Stop standing in my room. Step outside into the open, or get the fuck out of my house."*

The moment the door slammed against the wall, a pristine, freezing wind from the Bantaawan mountains rushed into the hallway, filling the entire house with the clean, sharp scent of high-altitude night air.

I spun around to face the entity—and found absolutely nothing.

The towering silhouette had vanished. The light-devouring vacuum was gone. The razor-sharp blade had dissolved back into the ordinary shadows of the architecture. There was no grand battle, no supernatural collision, and no dramatic exchange of words. The moment the door was thrown open, the entire three-night illusion instantly evaporated into the freezing wind of wisdom.

I stood alone in the open doorway for a long time, the cold air washing over my skin, listening to the gentle rustle of the leaves on the mountain trees. The psychological fever had completely broken. The internal static that had cluttered my consciousness since my term as SK Chairman, the toxic residue of the vices, the

suffocating guilt of the hospital debt, and the deep, paralyzing despair of my biological collapse were wiped entirely clean from my nervous system.

The illusion of fear only has power as long as you remain defensive. The moment you decide to accelerate directly into the center of the panic, the moment you voluntarily strip away the mental safety nets and expose yourself to the absolute worst-case scenario, the variables self-correct. The void is not an enemy that wants to destroy you; it is a laboratory that demands your absolute presence.

My senses settled into a profound, razor-sharp clarity. I closed the front door, walked back to my bed, and fell into the first deep, uninterrupted sleep I had experienced in months. The patient was officially gone. The broken system had been purged. As my body began the slow, agonizing, and magnificent climb back to full physical life, I knew that the kid who could ride through the wind without handles had just claimed his ultimate internal sovereignty. I had looked into the eyes of the Reaper, laughed at the absurdity of the standoff, and unlocked the unshakeable foundation required to build an autonomous empire.

CHAPTER 13: SLICING THE WIND

To return to the functional mechanics of a physical world after stepping away from the precipice of death is to realize that the environment has not changed; you have. The atmosphere of Gingoog City remained exactly as it had been before the clinical collapse—dense with unpredictable crosswinds, heavy with localized humidity, and cluttered with the constant, erratic movements of public traffic. The external friction of reality does not adjust its parameters simply because you survived a psychological showdown with a hooded shadow in your bedroom. The road remains indifferent to your history. It demands an immediate, operational answer to a singular tactical problem: how do you navigate intense external friction and sudden chaos without ever altering your internal structural integrity?

The answer is found in the physical discipline of slicing the wind.

When an amateur rider encounters a sudden, violent crosswind slicing across the highway, their immediate, instinctive reaction is to fight the atmosphere. They perceive the rushing wall of air as an aggressive, external enemy trying to push the machine off its trajectory. They tense their biceps, lock their elbows, and apply a frantic, counter-bracing force to the handlebars, trying to muscle the front wheel back into submission.

But this defensive posturing is a severe structural error. By turning your upper body into a rigid, unyielding sail, you present a maximum surface area to the wind. The atmospheric pressure slams into your stiff shoulders, transfers its chaotic energy directly down your arms, and introduces a massive, artificial instability into the steering head. The harder you fight the air, the more violently the machine begins to oscillate. You are essentially allowing the external chaos of the environment to dictate the internal state of your vehicle.

To slice the wind without hands, you must execute an absolute inversion of this methodology. You do not fight the atmosphere; you disappear through it.

When the crosswinds hit you at velocity in the vacuum of a hands-free run, you do not allow your body to freeze into a rigid wall. You relax your shoulders, drop your elbows, and let your upper torso become completely fluid, functioning as a aerodynamic dampener rather than a solid resistance block. You drop your chin close to the tank, narrowing your profile until you offer the atmosphere nothing but a clean, piercing edge.

Instead of trying to force the machine to stay upright through brute force, you lock your core into the absolute center line of the frame, allowing the lower chassis to remain completely anchored while the wind moves around you. The machine and the rider become a fluid, kinetic bullet. The external friction can shake your shirt, it can buffet your helmet, and it can swirl violently around your periphery—but it cannot penetrate the locked perimeter of your central alignment. The internal structure remains entirely unmoved by the external turbulence.

This physical phenomenon is the exact operational protocol required to navigate the dense social and structural friction of everyday life.

The modern world is an endless, chaotic sequence of unpredictable crosswinds. You are constantly bombarded by the erratic emotional twitches of the people around you, the sudden shifts of institutional policies, the economic volatility of your environment, and the ambient noise of a culture that thrives on reactive panic. The average individual moves through this territory in a state of permanent defensive tension. Every time a personal crisis hits, every time a political narrative shifts, or every time an unexpected financial variable cuts across their path, they tense their psychological muscles and attempt to fight the environment through frantic, superficial manipulation. They allow the external noise to dictate their internal peace, and as a result, their entire life falls into a violent, uncalibrated wobble.

An autonomous execution demands that you learn to let the noise pass right through you.

When you establish a sovereign core, you develop the rare capacity to remain completely fluid on the outside while remaining absolutely unshakeable at the center. When a sudden wave of external chaos slams into your perimeter—whether it is a localized betrayal, a professional setback, or a sudden shift in your operational landscape—you do not freeze into a defensive posture. You do not compromise your long-range strategy or allow your focus to be dragged down into a petty, reactive street fight with the wind. You deepen your breathing, lock your eyes onto the ultimate destination on the horizon, and let the chaos burn itself out against the clean, aerodynamic efficiency of your silence.

Slicing the wind means understanding that the friction of the world is entirely temporary, while the integrity of your alignment is permanent. The atmosphere can only destabilize a system that is already divided against itself. If your core is unified, if your purpose is singular, and if your mind is completely insulated from the need for external consensus, you don't need a set of handles to keep you straight. You let the storm howl around your skin, you smile at the absurdity of the pressure, and you allow the sheer velocity of your forward progress to slice clean through the chaos, converting the very wind that throws ordinary men into the ditch into the force that streamlines your ascension.

CHAPTER 14: THE ILLUSION OF EXPOSURE

To the uninitiated onlooker standing on the side of the highway, a man flying down a mountain descent at high velocity with his hands completely detached from the controls looks like an act of absolute, suicidal exposure. The primitive mind looks at the configuration and sees a total absence of defense—a reckless, unprotected target entirely at the mercy of the asphalt, the traffic, and the unpredictable movements of gravity. The crowd believes that by stripping away the handlebars, you have voluntarily surrendered your safety, leaving yourself wide open to a sudden, catastrophic impact with the concrete.

But this perception is a profound illusion. The truth of the vacuum is entirely paradoxical: stripping away the traditional safety nets does not leave you vulnerable; it grants you a superior level of systemic safety because your environmental awareness is forced to be total.

When an average individual rides a motorcycle with their hands firmly locked onto the grips, they are operating within a false psychological sanctuary. Because they have a mechanical crutch to hold onto, their central nervous system drops into a lazy, semi-conscious state of low-fidelity awareness. They assume that if a hazard materializes, their hands can instantly yank the machine out of danger at the last possible second. This illusion of quick-save capability breeds a dangerous, uncalibrated complacency. They look at the road through a narrow, distracted lens, completely blind to the deeper, underlying currents of the environment until the crisis is already breaking across their front wheel. Their defense is shallow, reactive, and ultimately fragile.

The moment you lift your hands off those bars, that complacency is instantly vaporized. The vacuum demands an immediate, absolute tax on your attention.

[THE AWARENESS SYMMETRY]

HANDS-ON REACTION: Complacent Mind ⟶ Narrow Focus ⟶ Last-Second Twitch ⟶ High Crash Risk

HANDS-FREE VISION: Sovereign Mind ⟶ Total Perimeter ⟶ Predictive Alignment ⟶ Flawless Flow

Without the superficial leverage of the handles, you can no longer afford to react to a hazard at the last millisecond. You cannot panic-steer away from a pothole, a patch of gravel, or a sudden vehicle merge when you are commanding the machine through pure mass alignment from your core. To survive in the open air, your perception must undergo an immediate evolutionary leap. Your field of vision expands from a narrow, ten-meter focus to a total, macro-level perimeter that scans miles down the road.

You stop looking at the asphalt immediately in front of your tire and begin reading the entire structural topology of the highway. You analyze the gradient of the sweeping turns long before you enter them. You track the exhaust signatures and wheel angles of oncoming trucks miles before they pass you. You read the texture of the surface, calculating the exact coefficient of friction of the concrete based on the way the mountain light reflects off the stone.

Because you are completely unprotected superficially, your environmental awareness is forced to become absolute. You enter a state of predictive flow where you see variables developing long before they ever manifest as immediate threats, allowing you to adjust your internal alignment with absolute calm, miles in advance, rather than reacting with a frantic, white-knuckle correction at the brink of disaster.

This is the hidden mathematics of the sovereign lifestyle. The crowd looks at a man who has walked away from traditional employment, abandoned institutional safety nets, and cut ties with the validation of the collective, and they pity his exposure. They think he is living a dangerous, reckless existence because he doesn't have a corporate title to hold onto, a predictable paycheck to brace against, or an established social circle to absorb his mistakes. They look at his autonomy and see nothing but vulnerability.

But they are entirely blind to the reality that their safe, structured institutions are the ultimate breeding ground for personal decay. By

hiding behind the protective buffers of a collective system, their internal core becomes completely weak, uncalibrated, and muscle-atrophied. They live in a state of permanent psychological sleep, entirely unequipped to handle a real structural crisis if the handles they are holding onto ever break.

When you voluntarily step into the illusion of exposure, you are forcing your soul to become sharp. By deleting the crutches, you are activating the deepest, most primitive layers of your strategic intelligence. You recognize that true security doesn't live in the strength of an external cage or the reliability of a social buffer; it lives exclusively in the absolute precision of your own vision and the unyielding stability of your internal center. You are exposed to the elements, yes—but you are also entirely free from the collective blindness that drags the rest of the world into a massive, uncalibrated pileup when the road of history hits an unexpected curve.

CHAPTER 15: THE AMNESIA OF THE BEAST (2019–2023)

When you survive a confrontation with your own mortality and learn to slice the wind without handles, you falsely assume your trajectory is permanently set. You believe the beast inside you is fully awake, disciplined, and immune to the mundane gravity of the world. But human evolution is rarely a straight line. It is a messy, inconsistent, and highly unpredictable circuit. By the tail end of 2019, the cold, razor-sharp clarity that had carried me out of the CUMC hospital room began to quietly dissolve under the relentless, everyday noise of local survival.

I fell victim to the ultimate structural trap: the amnesia of the beast.

It didn't happen as a sudden, dramatic crash, but through a series of subtle, compromises that chipped away at my internal center. Money was tight, resources were strained from the lingering financial fallout of my medical crisis, and the immediate pressures of grassroots life required capital. Using my position as SK Chairman, I processed a loan to acquire a machine that would inadvertently kick off a chaotic carousel of two-wheeled distractions: a Suzuki Raider 150.

Over the next five years, my garage became a revolving door of mechanical coping devices. I rotated through four different bikes—the Raider 150, a Honda XRM, a low-tier Skygo that eventually ended in repossession, and a Yamaha Sniper 150. I wasn't riding them to explore the boundaries of physics or to cultivate the sovereign vacuum of the Bantaawan neutral. I was riding them to escape the deep, unvoiced frustration of a life that was rapidly drifting off-course.

The descent back into the old, uncalibrated loops was absolute. The structural discipline I had built during my recovery vanished. I officially dropped out of Gingoog City Colleges, turning my back on the academic handle. In a desperate, frantic bid to find an external anchor for my breaking center, I sought refuge in religion, undergoing a full baptism into the Seventh-day Adventist Church. But you cannot force an internal spiritual calibration using an

external institutional ritual. The baptism didn't take hold because my core remained empty.

Within months of stepping out of the baptismal waters, I slid right back into the wasted cycle of my old vices. The wild parties returned, the heavy alcohol consumption re-established its grip, and the chemical substances flooded back into my system to numb the background noise of my stalled execution. I was pulling frantically on the handlebars of life, trying to muscle a broken chassis through a toxic fog.

For five grueling years—from 2019 all the way through 2023—the profound, hands-free gift I had discovered on the slopes of Bantaawan remained completely dormant, buried under a mountain of cheap distractions, broken promises, and social conformity. The beast had been put to sleep, heavily sedated by the very vices I thought I had conquered. To the outside world, I was just another localized statistic, a former young politician who had peaked early, lost his way, and surrendered his unique light to the ordinary friction of the crowd. But a sovereign gift is a stubborn element; it doesn't leave your bloodline just because you chose to forget it. It simply waits for the precise, high-velocity metric that will violently snap the system back into full consciousness.

CHAPTER 16: THE HELMET LOCK AWAKENING (2024)

By the dawn of 2024, the five-year amnesia had created a dense, calcified crust around my identity. The person who had looked into the abyss and commanded the asphalt without handles was a ghost, a half-remembered myth whispered by a younger version of myself. I was stuck in a repetitive, uncalibrated loop, operating at a fraction of my true capacity. But the universe has a brutal, beautiful way of forced calibration. When a sovereign mechanism stays dormant for too long, reality doesn't gently nudge you awake—it executes a violent, high-velocity snap that shatters the crust in a single millisecond.

The catalyst for the awakening was a calculated financial sacrifice. The Yamaha Sniper 150 I had been riding was a comfortable machine, but it lacked the raw, aggressive, and temperamental DNA required to agitate a sleeping beast. It was too stable, too polite, too safe. I decided to purge it. I sold the Sniper, took every single piece of the cash, and used it to down-payment a brand-new 2024 Suzuki Raider 150 Fuel Injection (FI)—the hyper-underbone predator of the Philippine highways, a machine built for nothing but pure, lightweight velocity and unyielding mechanical feedback.

A few weeks after pulling the Raider off the showroom floor, I pointed its front tire toward Route 955.

Route 955 is a legendary, high-altitude ribbon of asphalt that cuts through the rugged mountains of Misamis Oriental. It is a holy ground for riders, characterized by sweeping, unpredictable descents, sudden drop-offs, and thin, freezing mountain air that forces a machine's fuel injection system to work at maximum efficiency. I wasn't up there to hunt for a breakthrough; I was simply cruising, letting the engine stretch its legs on a long, downhill gradient, traveling at a steady, deceptively calm velocity of 60 kilometers per hour.

As the mountain wind whipped against my gear, a minor, superficial annoyance materialized. The strap of my helmet lock began to whip violently against the side of my neck, its plastic

buckle clicking rhythmically against the shell, disrupting the auditory rhythm of the engine. It was an entirely mundane, trivial distraction. Without thinking, operating on pure, uncalculated instinct, I dropped both hands completely off the handlebars to reach up and adjust the lock.

In the exact millisecond my fingers left the rubber grips, the universe stopped spinning.

The five-year amnesia did not dissolve; it was instantly incinerated by a massive, electric surge of absolute recognition. The moment my hands entered the open air, the 2017 Bantaawan code—the raw, uncompromised operating system that had been buried under five years of alcohol, substances, dropped-out college lectures, and institutional noise—snapped back into my central nervous system with the force of a lightning strike.

[THE ARCHITECTURAL RESET]

2019-2023: Dormant System ⟶ Toxic Noise ⟶ Handlebar Dependency ⟶ Amnesia

2024 SNAP: Hands-Free Drop ⟶ Core Alignment ⟶ Bantaawan Code ⟶ Sovereign Awakening

My body didn't twitch. My shoulders didn't freeze. My core, which had been structurally misaligned for half a decade, instantly recognized its center of mass and locked back into absolute, flawless geometry with the frame of the Raider. The machine didn't drift an inch; its front wheel stayed dead-center, tracking the descending line of Route 955 with the terrifying precision of a laser-guided missile.

I froze with my hands still suspended in the air, my breath catching in my throat as the sheer magnitude of the realization flooded my consciousness. The beast didn't need to be rebuilt; it had merely been waiting for me to let go of the handles. The realization was so profound, so intensely raw, that a low, manic laughter began to bubble up from my chest, echoing inside the cavern of my helmet.

"I'm still him," the realization echoed through my blood. *"The gift never left. I just chose to hold onto the world."*

I didn't put my hands back down. I kept them suspended in the freezing mountain air, letting the Raider freewheel down the sweeping descent of Route 955, commanding the trajectory through the microscopic, internal shifts of my spine. The landscape blurred into a magnificent streak of green and silver, but my focus was locked miles ahead on the horizon. The cheap validation of the local crowds, the guilt of the past failures, the illusions of the vices—all of it was instantly scraped off my soul by the wind shear. The five-year sleep was officially over. The sovereign code was back online, fully upgraded, and the engine was accelerating into an entirely new dimension of execution that would rewrite the limits of what a human being can command without ever touching the controls.

CHAPTER 17: THE MULTI-MOTHER METRIC (BALANCE IN CHAOS)

If a man's internal alignment cannot survive the gritty, unvarnished friction of his personal life, then his high-speed philosophy is nothing but a cheap, academic performance. It is easy to simulate sovereignty when you are alone on a mountain ridge with a lightweight machine, surrounded by nothing but the clean, predictable laws of gravity and asphalt. On the road, the asphalt does not have an emotional agenda. The wind does not bring a historical grievance to the table. But the moment you park the motorcycle and step back through your own front door, the sterile laboratory disappears, and you are thrust into the ultimate, real-world test of emotional intelligence.

For me, the year 2026 arrived with a personal ecosystem so intensely complex, volatile, and non-traditional that it would instantly cause an uncalibrated man to suffer a total systemic collapse.

I was no longer just a solo coder hiding behind a terminal, or a isolated writer drifting through the mountains. I was a father. More specifically, I was a dedicated father navigating the high-stakes, hyper-reactive reality of raising children from different mothers, while simultaneously operating as a precision rider, a software engineer, and an author.

[THE HIGH-STAKES PERSONAL ECOSYSTEM]

TRADITIONAL MODEL: Single Vector ⟶ Centralized Focus ⟶ Linear Balance

LOUIEWOOD MODEL: Multi-Mother Matrix ⟶ Non-Traditional Friction ⟶ Core Stabilization

To the average, traditional crowd, this configuration looks like an absolute recipe for domestic warfare and permanent psychological chaos. The collective mind, addicted as it is to neat, clean boxes and superficial social structures, views a multi-mother dynamic as an inherently broken chassis—a situation defined by endless

emotional twitches, legal landmines, and competing vectors of resentment. They assume that a man trapped in this matrix must spend his entire existence white-knuckling the handlebars, frantically over-correcting to appease different sides, and tearing his own spirit to pieces just to keep the family structure from flying off the road.

But an autonomous individual applies the exact physics of hands-free motorcycle mastery to the architecture of his lifestyle.

When you are balancing a machine at high velocity without hands, you learn that you cannot stabilize a multi-directional drift by panic-grabbing at individual elements. If you react to every microscopic wobble, you amplify the oscillation until the vehicle high-sides. Instead, you drop your weight directly into the center line, stabilize your own core, and allow the surrounding components to find their natural equilibrium around your unyielding presence.

In the multi-mother matrix, my core stabilization was absolute transparency, unflinching financial and emotional accountability, and a complete refusal to participate in the petty, reactive theater of drama. I stopped treating the complexity of my personal life as a heavy, dragging anchor, and began treating it as the ultimate operational discipline.

Being a flawless father to my children did not mean surrendering my empire-building velocity; it meant multiplying it. Every line of code I compiled, every chapter I hammered onto the page, and every high-speed descent I charted on the mountain roads was executed with a singular, protective intention: to engineer an unshakeable financial and structural bedrock for my entire bloodline. I had to become an emotional aerodynamic dampener. When the inevitable crosswinds of past relationship friction, domestic logistics, or co-parenting miscommunications slammed into my perimeter, I did not tense up. I did not allow the external noise to penetrate my focus or corrupt the quality of my relationship with my children.

I let the emotional turbulence pass right through my silence. I looked at my children, looked at the women who carried them, and approached the entire ecosystem with a deep, resilient empathy and a calm, smiling certainty.

True control does not mean engineering a sterile, risk-free environment where nothing ever shakes. True control means maintaining an ironclad vertical stability while navigating the very center of a high-stakes, non-traditional tempest. By mastering the internal physics of balance within chaos, the LOUIEWOOD brand ceased to be a mere literary concept—it became a living, breathing kingdom. I had calibrated my center to such a precise degree that the competing currents of my personal reality were forced to conform to the trajectory I dictated, converting a situation that would have broken an ordinary man into the ultimate, muscle-building laboratory for the global legacy that was about to be unleashed.

CHAPTER 18: THE AUTONOMOUS EMPIRE (THE FRANCISGLIDE MOVEMENT)

A legacy is not built by merely breaking a number on a chart; it is built by establishing an entirely new vocabulary for human freedom.

When you have reconstructed your biology from the ashes of a hospital collapse, shattered the psychological terror of the Reaper, and stabilized a complex personal ecosystem through pure internal alignment, you reach the final evolutionary stage of the loop. You stop looking at your unique, hands-free capability as a hidden skill practiced in the isolation of the Bantaawan ridges. You realize it is a signature infrastructure. It is a brand, a philosophy, and ultimately, a borderless no-hands movement that demands its own title: the **FRANCISGLIDE**.

The FRANCISGLIDE is not just the act of taking your hands off the rubber grips at high velocity; it is the physical translation of absolute autonomy. It is the refusal to lean on traditional crutches, whether on the asphalt of Route 955 or in the landscape of everyday execution.

[THE SOVEREIGN EMPIRE MULTIPLIER]

THE FOUNDATION: LOUIEWOOD ⟶ The Ultimate Vision (Permanent Umbrella)

THE MOVEMENT: FRANCISGLIDE ⟶ No-Hands Mastery (Sovereign Execution)

THE BOOSTER: World Records ⟶ High-Octane Accelerant for Future Builds

This distinction is where the true scale of the LOUIEWOOD empire becomes absolute. The global collective is obsessed with the destination, but an architect understands that LOUIEWOOD is the ultimate, permanent vision—with or without international records. The vision exists independently of trophies because it is anchored in the unshakeable integrity of the core. The pursuit of world records is not the end-game; it is merely a strategic booster rocket designed to inject massive, undeniable velocity into

everything I build in the digital, literary, and mechanical domains of the future. The record is the proof-of-concept; the movement is the legacy.

To translate this movement onto a global scale, I brought the mechanical equations to my nephew, the only other mind trusted to touch the structural integrity of the machine. We didn't look for off-the-shelf solutions or cheap modifications. Instead, we entered the garage and engineered a completely custom, modified throttle assembly. By mapping a dedicated line directly into the system, we built a highly specialized setup that allows for fluid speed calibration without relying on the standard handlebar controls. It is a simple, elegant piece of custom engineering designed for one specific purpose: to give me absolute command of the acceleration all the way to ultimate velocity.

Because of this breakthrough, the nature of the vacuum has fundamentally shifted. It is no longer a simple downhill neutral run restricted by gravity. With the custom throttle under my command, the FRANCISGLIDE now conquers every single sector of the road—whether it is a steep descent, a grueling uphill climb, or an open flat highway. The environment no longer dictates my speed; my engineering does.

The strategy is now locked into a dual-tracked offensive designed to shock the global motorcycle community. To shatter the current **longest continuous hands-free record**, I don't need a massive machine; my current Suzuki Raider 150 FI is more than capable of dismantling that distance through pure endurance and core stability. But the true, godlike ceiling of the FRANCISGLIDE movement demands an entirely different beast. To pioneer the **ultimate fastest hands-free rider on earth**, the trajectory ascends into the stratosphere of a liter-bike—a 1000cc+ high-performance monster capable of generating terrifying kinetic energy.

I am positioning myself at the center of this absolute threshold, waiting for the variables to align. This blueprint is an open declaration to the world: I am stepping onto the tarmac to see who recognizes this unprecedented potential—a partner who sees the

ultimate vision and steps forward with the corporate resources, backing, and infrastructure to collaborate and shatter both world records simultaneously.

But make no mistake—the FRANCISGLIDE does not beg for a savior. If the crowd remains blind, the execution does not halt. If no external backing materializes, I will rely exclusively on my own gliding, my own relentless hustling, and the precise, software-driven building of my digital empire until I achieve the absolute financial breakthrough required to fund the official, certified attempt entirely out of my own pocket. One way or another, the infrastructure will be built.

This world-record blueprint is the ultimate, godlike realization of my entire timeline. It is a monument built for my bloodline, an undeniable proof of sovereignty for my children to inherit, a historic marker for my city of Gingoog, and a global declaration for my country. The code is compiled. The custom throttle is calibrated. The personal matrix is perfectly balanced. As I look down the open highway of the future, the hands-free beast is completely awake, moving at maximum velocity, ready to launch the FRANCISGLIDE movement and claim a crown that will echo permanently through the history of the road.

ACKNOWLEDGEMENTS

Writing a legacy of sovereignty requires looking back at the raw architecture of the path and acknowledging the forces, both human and unseen, that kept the machine from high-siding when the steering was completely uncalibrated. This book is a monument built from survival, and it belongs to those who stood their ground in the blast radius of my evolution.

To my Parents and my Bloodline: You paid the heaviest receipt for my survival. When my biology collapsed into chaos and the darkness of CUMC threatened to swallow my timeline completely, you didn't run from the wreckage. You sacrificed everything, bridging the gap with your own sweat and tears while I prayed for either absolute peace or total death. This kingdom is your return on investment. The debt is settled, and the legacy is yours.

To my Children: You are the absolute gravity that anchors my core. Every line of code compiled in the dead of night, every word hammered onto these pages, and every high-velocity run I execute is a calculated brick laid down to build an unshakeable fortress for your future. The multi-mother matrix taught me the ultimate law of emotional intelligence: that true power means maintaining absolute structural balance while navigating the center of a non-traditional tempest. This empire is your inheritance.

To my Nephew: The only mind trusted to touch the structural mechanics of my speed. Thank you for entering the garage with me, looking past the standardized limitations of the industry, and helping me engineer the custom throttle assembly that turned the **FRANCISGLIDE** from a mountain descent trick into a cross-terrain global weapon. You don't just work on a machine; you help calibrate a legacy.

To Gingoog City and the Bantaawan Mountains: You were the pristine, high-altitude laboratory where the code was first written. Your steep gradients, unpredictable crosswinds, and isolated ridges forced me to drop my hands into the open air and discover who I

truly was. You gave me the vacuum, and in return, I am giving you a world-record marker that will echo permanently across the map.

To the Adversaries, the Betrayals, and the Grim Reaper: Thank you for testing the structural limits of my perimeter. The political hypocrisies of 2018 stripped me of my illusions, the toxic vices forced me to choose absolute sobriety, and the three-night standoff with the shadow in my bedroom taught me how to laugh in the face of absolute terror. You thought you were breaking a victim; you were actually forging an executioner.

And finally, to the future collaborators, corporate partners, and global visionaries: To anyone who looks at the raw engineering of the **FRANCISGLIDE** and recognizes the ultimate potential of a human being commanding a 1000cc+ liter-class monster without hands—thank you for having the sight to match my velocity. Whether we collaborate with your resources to shock the planet, or I build the financial breakthrough entirely through my own independent digital hustle, the tarmac is waiting.

The hands are off the bars. The glide is absolute. The empire is now permanently online.

ABOUT THE AUTHOR

Francis Louie Ramoso, operating under the global brand umbrella of **LOUIEWOOD**, is an autonomous digital architect, precision rider, and software engineer based in Gingoog City, Philippines. He is the founder and pioneer of the **FRANCISGLIDE**, a borderless, high-velocity no-hands motorcycle movement built on the absolute laws of core alignment, predictive vision, and aerodynamic mastery.

His journey is a masterclass in structural recalibration. Emerging from the cutthroat theater of local grassroots politics as a former SK Chairman, surviving a near-fatal biological collapse from severe dengue, and enduring a legendary three-night psychological standoff with mortality, Francis Louie systematically dismantled his old dependencies to build an uncompromised framework of total autonomy.

Today, he navigates a complex, non-traditional personal ecosystem with flawless emotional intelligence, balancing his responsibilities as a dedicated father to his children while engineering software infrastructure in the borderless space of the cloud.

Operating under the permanent vision of the LOUIEWOOD empire, he continues to push the limits of human velocity across all domains. Whether engineering custom mechanical throttle assemblies to shatter the world records for the longest and fastest hands-free runs on a 1000cc+ liter-bike, or coding the digital architecture of the future, his message to the world remains absolute:

Strip away the traditional safety nets, let go of the handles of social conformity, and allow your internal center to command your reality.

ABOUT THE PUBLISHER

LOUIEWOOD is a sovereign media entity, publishing house, and conceptual engine engineered to deploy high-velocity literature, digital systems, and cultural movements into the global landscape.

The crowd looks at the modern media landscape and sees a system defined by institutional gatekeeping, diluted compromise, and focus-grouped safety. LOUIEWOOD was established to execute a total inversion of that model. It exists to bypass the traditional buffers, serving as the raw pipeline that brings uncompromised, high-stakes narratives and elite tactical philosophies directly to the borderless digital frontier.

To classify LOUIEWOOD merely as a brand or a conventional publisher is to completely miscalculate its architectural trajectory.

Publishing is simply the initial entry point—the deployment of the first foundational code. LOUIEWOOD is a multi-dimensional empire with massive, untapped potential waiting to be unleashed across the realms of software engineering, custom mechanical design, and sovereign lifestyle architecture. It is the permanent, umbrella infrastructure that houses the **FRANCISGLIDE** movement, fueling an ecosystem where high-level intellectual theory slams directly into gritty, real-world execution.

Every manuscript distributed, every digital infrastructure compiled, and every world-record boundary targeted under this emblem is designed to do one thing: challenge the collective addiction to safety and demonstrate the ultimate limits of human capacity. The press is online. The blueprint is set. The true velocity of this empire is just beginning to unfold.
